

This homework is due on **December 4, 11am ET**.

You are welcome to work with others, however you must explicitly list all collaborators and materials that you used. You must write up your own solution and your own code to every problem. See Georgetown University Honor System. When in doubt, ask the instructor what is allowed.

Problem 1 (Substitution ciphers). In the class we saw that even though substitution ciphers have reasonably long keys, they are not secure. Decode the following ciphertext encrypted by a substitution cipher.

S ilqa l ocaln jilj pxa olh jisr xljspx esmm csra tb lxo msqa ptj jia jeta nalxsxu py sjr wcaao: Ea ipmo jiara jctjir jp fa ramy-aqsoaxj, jilj lmm nax lca wcaljao adtlm. S ilqa l ocaln jilj nh yptc msjjma wismocax esmm pxa olh msqa sx l xljspx eiaca jiah esmm xpj fa vtouao fh jia wpmpc py jiasc rksx ftj fh jia wpxjaxj py jiasc wilelwjac. S ilqa l ocaln jpolh.

Feel free to use tools that count frequency of characters in the ciphertext, letter/digram frequency tables (e.g., here), common sense, or implement any tools in your favorite programming language. Name the author of this text, and explain how you arrived at the solution.

Problem 2 (Breaking RSA). Implement four attacks from Lecture 23 on the Textbook RSA to solve the following puzzle: <https://colab.research.google.com/drive/1E-6MckqLY-BEb5VpqChC33WalOQ1Neb6?usp=sharing>
